Education

University of Cordilleras (Senior High School)
Attended from August 2016 to October 2018
University of Cordilleras

Graduate of Bachelor of Science in information Technology (Major in Network And Security)
Attended from September 2018 to September 2022
University of Cordilleras

Skills Summary

Category	Machine Learning	Mobile App Development	Game Development	Web Development
Languages	Python -R	Java Kotlin Flutter PHP or Basic Web Tech	C# C++ Javascript	JavaScript Python PHP Wordpress
Database/ Operating System	MySQL, PostgreSQL, MongoDB, SQLite, Room, Firebase, Supabase, (Vector DB: Pinecone, Weaviate, Faiss) Linux, Windows, Android			
Libraries	NumPy, Pandas, Matplotlib, TorchVision, Keras, Pytorch, Scikit-learn, OpenCV, YOLOv11, OpenVINO Platform: Roboflow, HuggingFace	React Native, Cordovova, Retrofit, RxJava, Jetpack, Retrofit, Kotlin Coroutines,Glide, Dagger Hilt	OpenGL DirectX	React native, js Vue.js Angular JQuery Asp.net
Frameworks/Tools	Jupyter Notebook, Anaconda, Docker, langchain, langflow, LlamaIndex ,TensorFlow, AWS, EC2, Lambda, Google Cloud, Digital Ocean, Git	Multi-OS Engine, Codename One, Appcelerator Titanium, Ionic, Cordova, Capacitor, PWA Builder, Git	Unity Blender Git	Bootstrap, Tailwind, Django, Flask, Laravel, CodeIgniter, Cpanel, Git, Vercel
Automation Workflow	**Low Code Automation Platforms :** n8n, Zapier, Make, Smythos, Abacus.Ai, **Ai Coding tools :** Claude, code, Claude design, Codex (GPT), Qwen, Ollama, Github Copilot, Letta Code		**Platforms :** Ringcentral, Synthesia, GHL, Slack, Delphi.Ai, HuggingFace, Airtable, Lovable, 11labs **Default Frameworks:** MCP setup, skills setup, Embedding, Transformers, Prompt Engineering, Multi Agent Orchestration, Message Parsing, State Management	
Soft Skills	Analytical Thinking, Continuous Learning, Problem-Solving, Time Management, Communciation Skills, Teamwork, Leadership, Critical Thinking	**CRM, Collaboration, Communication tools:**	Go high level, Hubspot, Zoho, Google Workspace, Jira Atlassian, Slack, Contentful, ClickUp, Ms teams, Scrum master	

Work Experience

Recent Project

Full-Stack Developer + AI Engineer + DevOps Architect | Solo Developer of Enterprise-Grade Marketing Automation Platform (Solo Developer) **LINK**
Wonder Group Pty Ltd — Project: LIVITI AI Content Studio **January 27, 2026 – March 20, 2026**

- Architected and built a fully autonomous, AI-powered content generation platform from the ground up, replacing an entire content marketing team (10+ roles) with a system of 6 specialized AI agents, resulting in estimated
- annnual savings of $474,000–$624,000 in team and tooling costs.
- Designed and implemented a complex 6-agent AI pipeline (Orchestrator, Researcher, Writer, Critic, Editor, Image Agent) using n8n Cloud. Orchestrated multi-step workflows for researching, writing, scoring, and publishing SEO- optimized content, reducing the time to produce 5 complete blog articles from days to 25–30 minutes.
- Engineered a proprietary 24-criteria SEO scoring engine (LIVITI Scorer) evaluating content across SEO, Tone, and Structure dimensions, ensuring a first-pass quality score of 80–100%.
- Developed a full-featured, responsive Vue 3 dashboard with over 40 custom components, featuring real-time pipeline monitoring, conversational AI chat interface, side-by-side content version comparison, and a comprehensive admin panel with 15 distinct management sections.
- Built a robust Node.js + Express backend API with over 20 route modules and 15 utility libraries. Managed
- database architecture using PostgreSQL with pgvector on Supabase, handling 10+ tables.
- Led all DevOps and infrastructure initiatives — CI/CD pipeline with GitHub Actions, automated deployment to DigitalOcean, server management using cPanel, Docker, and nginx.
- Integrated 14 third-party services including Gemini 2.0 Flash, SearXNG & Perplexica, Pixabay, Surfer SEO API, and Zoho Cliq for automated team notifications.
- Implemented automated content marketing workflow running daily at 6:00 AM AEST — generating 5 unique
- articles, scoring, auto-publishing to WordPress with full SEO metadata, and distributing PDF reports — all without manual intervention.
- Created system health monitoring with "Kill Switch Guard" for emergency disconnect, comprehensive session logging, and auto-heal capabilities for 24/7 reliability.
- Solely responsible for the entire technology stack (frontend, backend, AI/ML, SEO engineering, DevOps) — a scope typically requiring 10–12 specialists.

Recent Employment

Head Automation Engineer — AI / Full-Stack
Excis Compliance Corporation · September 2025 – Present · Remote (Philippines) **LINK**

What the Project Does (Goal & Purpose)

Excis bills global enterprise customers (HCL/Caterpillar and others) for thousands of on-site IT support tickets every month across APAC, EMEA, North America and LATAM. Before the platform existed, finance and SDM teams compiled invoices manually in Excel — pulling tickets from ManageEngine, looking up the right rate card per country, applying VAT rules, matching each ticket to a Purchase Order, and emailing the file around for approval. The cycle took days, errors compounded, and there was no audit trail.

I led the design and delivery of an end-to-end automation that takes a finance operator from "raw tickets in ManageEngine" to "approved PO-deducted invoice ready for Xero" in a single browser session — with AI doing the heavy lifting on validation, rate-card matching, and anomaly detection.

Business Outcomes & Impact

- Cut a typical monthly billing cycle from 3–5 days of manual work down to under 2 hours per customer batch — roughly an 85–90% reduction in cycle time.
- Eliminated ~95% of manual data-entry effort in invoice generation. Operators no longer copy ticket data into the FSO Excel template by hand — the platform stamps every field (rates, VAT, currency, PO assignment, totals) automatically.
- Drove rate-card match accuracy to ~95% on first pass using a hybrid AI matcher (deterministic scoring + AI vector-search fallback). Replaces an LLM-only workflow that was both slower and less accurate, while reducing AI token spend by ~80%.
- Reduced billing errors and rework by an estimated 70–80% by validating every ticket with AI against the FSO calculation rules (Dispatch / Dedicated / SV / Standby / Project) before it ever reaches a reviewer.
- Brought the human-approval loop from email-thread limbo down to a single-click in-app review — collapsing approval turnaround from days to minutes (estimated ~75% faster).
- Delivered 100% audit traceability, up from effectively 0% — every ticket fetch, AI decision, rate-card match, human approval, PO deduction, and invoice push is now permanently logged with timestamps, actor, and reason.
- Scaled coverage from a single region to 4 regions (APAC, EMEA, NAM, LATAM) in one pipeline, with automatic country → region inference and per-country VAT rule resolution — removing the need for region-specific spreadsheets.
- Cut PO reconciliation overhead by an estimated ~60%: tickets are now matched to Purchase Orders automatically with balance-before/after tracking, and PO over-utilisation is flagged before invoicing instead of after.
- Removed duplicate-ticket inflation that was overstating finance totals by up to 6× on some PO reports — a deduplication retrofit collapsed 212 raw rows down to 33 true tickets, restoring trust in the figures.
- Replaced manual Xero entry with a direct API push: invoices now generate, get approved, and land in Xero as draft/submitted invoices automatically, removing a per-ticket manual step that previously consumed hours of finance time each cycle.
- Gave finance and operators a real-time billing pipeline dashboard (7 steps: Trigger → Ticket Match → Rate Match → File Gen → Upload → Approval → Invoice) — replacing email pings and Slack "is it done yet?" with live status visibility.

What I Owned

- End-to-end ownership of the billing automation pipeline — from ServiceDesk ingest, through AI validation and rate-card matching, to Xero invoice push.
- AI strategy and integration: which model to use where, when to fall back, and how to keep humans in the loop at the right moments.
- Operator-facing dashboards (Monitor Billing, Billing Run Wizard, PO Report, Step 4 Finalized Report) — designed for finance staff, not engineers.
- Continuous deployment to production cPanel hosting via automated CI/CD — every approved code change reaches the live billing site within minutes.
- Compliance & audit posture: persistent activity logs, versioned pre-billing files, OT/Weekend reason gates, and a tamper-evident timeline every reviewer can export.

Who Benefits and How

- Finance team — days of manual invoice prep replaced with a guided 3-step wizard.
- SDM / Operations — per-customer batch visibility, errors flagged before approval, no more spreadsheet versioning chaos.
- Customer accounts (HCL/Caterpillar etc.) — invoices arrive faster, formatted to the agreed FSO template, and consistent across regions.
- Leadership / Audit — a complete, exportable, time-stamped record of every billing decision and approval — for the first time.

One-Line Summary

Led the design and delivery of an AI-driven billing automation platform that cut Excis Compliance Corporation's monthly billing cycle by ~85%, removed ~95% of manual invoice work, and brought audit traceability to 100% — across four regions and a Tier-1 customer base.

AI Augmented Engineer | Full-Stack Developer | AI Marketing Specialist at GcorpCleans (September 2025 –February 2026)**LINK**

1. Product Ownership & Leadership
   - Spearheaded the design and implementation of GcorpCleans' end-to-end digital ecosystem, combining workflow automation, AI integration, and client-facing applications.
   - Acted as both Product Manager and Lead Engineer, aligning technical delivery with operational oversight and marketing objectives.
   - Directed cross-functional development across web, mobile, and automation platforms to ensure scalability, usability, and measurable business impact.
2. Chatbot & AI Integration
   - Integrated a custom AI chatbot into the mobile app (Flutter) for cleaners and clients, enabling appointment booking, job monitoring, and real-time communication.
   - Developed AI-driven engagement workflows using n8n, connecting the chatbot with backend systems and management dashboards.
   - Established seamless integration with GoHighLevel pipelines to support lead tracking and marketing automation.
3. Workflow Automation & Operations Oversight
   - Built Vue.js web-based management system for supervisors to track, manage, and monitor cleaning operations and staff performance.
   - Automated onboarding and operational workflows using n8n, reducing manual overhead and improving process transparency.
   - Designed dashboards for real-time job monitoring, pay tracking, and operational reporting.
4. AI-Powered Marketing & Lead Generation
   - Developed custom conversion lead tracking inside the system, enabling structured capture and funnel management.
   - Currently expanding marketing features: conversational lead flows, AI-driven automation, and pipeline integration with GoHighLevel CRM.
   - Streamlined lead capture and conversion through automated workflows, ensuring measurable ROI on marketing efforts.
5. Marketing Operations & SEO (In Development)
   - Building AI-enhanced marketing operations, including conversational lead tracking and automated campaign management.
   - Exploring SEO optimization and AI-generated content workflows to improve visibility and organic reach.
   - Preparing integration of AI-driven analytics for marketing performance monitoring.

AI Automation Engineer | Full-Stack Developer | AI MarketingSpecialistatAccess Insurance Underwrite LLC (February 2025 –August 2025)**LINK**

Key Contributions & Achievements:

1.Product Ownership & Leadership
   - Took full initiative to conceptualize, design, and implement the entire AI chatbot, automation, and integration ecosystem from the ground up.
   - Acted as Product Manager and Lead Automation Engineer, overseeing end-to-end development while aligning technical delivery with marketing objectives.
   - Directed cross-functional integration of AI technologies, ensuring scalability, usability, and measurable business impact.

2.Chatbot & AI Integration
   - Built a custom chatbot interface using Python & Django, integrating advanced AI platforms including Heygen, Synthesia, OpenAI, Abacus AI, and Delphi AI. Created AI agents with Abacus AI for dynamic customer
   - engagement. Deployed the system via Heroku, managing the full development-to-production pipeline.
   -

3.Workflow Automation & Avatar Systems
   - Designed n8n workflows to optimize avatar generation, reducing execution time and improving scalability.
   - Developed a centralized dashboard for analytics and avatar management, connecting with Slack, Google Analytics, and marketing tools.
   - Automated internal reporting pipelines, enabling real-time monitoring of avatar campaigns.

4.AI-Powered Marketing & Lead Generation
   - Built an automated avatar-based email marketing system that embedded avatars in customer responses, driving engagement and boosting lead generation efficiency by
   - Created automated email campaign manager integrated with the avatar engine, ensuring personalized and scalable outreach.
   - Streamlined lead capture and funnel conversion through AI-driven workflows.

5.Marketing Operations & SEO
   - Supported marketing operations by managing RingCentral inbound calls, capturing and addressing customer needs.
   - Enhanced SEO performance for the company's legacy website, improving search visibility and organic reach.
   - Produced AI-enhanced content for chatbots, marketing campaigns, and website optimization.

Full Stack Developer at Speech Improvement Center
(April 2024 – February 2025) **LINK**

- Spearheaded the development of a HR, Employee Dashboard, AnalyticsDatabase using PHP, improving patient record handling, appointment scheduling, and inventory management, resulting in a improvement in clinic operational efficiency.
- Engineered a secure, scalable web application with SQL for efficient data storage and retrieval, reducing data access time by 40% and increasing database performance by 25%. Designed intuitive, user- friendly interfaces with HTML, CSS, and JavaScript, enhancing patient and staff experience and increasing system adoption by 20%.
- Optimized clinic processes and workflows by identifying bottlenecks and applying automation, leading to a 15% reduction in patient wait times and improving overall clinic productivity by 20%. Tested and debugged the system using unit and integration testing, ensuring a 99% system uptime and minimizing error rates by 40%.

Ai Programmer for Abacus.AI Platform
(January 2023 – January 2024) **LINK**

- Developed the Abacus.AI platform using Python and Flask, implementing automated machine learning workflows, model deployment, and process workflows for AI agent customization, enabling users to tailor AI agents for specific business needs.
- Integrated cloud-based services (AWS) for scalable data processing and real-time model training, reducing setup time by 25% and simplifying onboarding for new users.
- Engineered a robust API system for seamless integration with external tools and databases, enhancing data pipeline efficiency and supporting customized AI agent workflows.
  Implemented an AI-driven recommendation engine powered by Abacus.AI's proprietary models, providing personalized insights and improving user engagement through tailored predictive analytics.

Mobile Application and Web Developer Freelancer
(September 2018 – January 2025) **LINK**

I am a freelance mobile and web developer specializing in building cross-platform and native applications using Android Studio, Flutter, React Native, and Ionic/Cordova. I develop high-performance mobile apps and responsive web platforms, focusing on usability, reliability, and seamless user experience.

I have hands-on experience building end-to-end systems—from mobile applications with real-time features and intuitive UI/UX to web-based dashboards and backend integrations using APIs and database systems. I work with modern technologies such as Java, Kotlin, JavaScript, and PHP, ensuring applications are scalable and production-ready.

I focus on delivering practical, user-centered solutions that solve real-world problems, whether it's developing mobile apps for business operations, integrating backend services, or optimizing performance across devices. I approach development with clean architecture, maintainable code, and efficient workflows.
I'm known for building complete applications independently, iterating quickly, and delivering reliable mobile and web solutions that are ready for real-world use.

Projects

Automation Engineer for Revaya Company
(August 2025 - December 2025) **LINK**

- Designed and deployed lead follow-up and appointment booking workflows using n8n and GoHighLevel (GHL), automating client engagement across Revaya's funnel.
- Implemented real-time lead capture with automated CRM updates and booking triggers, reducing manual scheduling by 60% and boosting conversion rates by 45%.
- Integrated GHL calendar and pipeline logic with n8n nodes to automate reminders, reschedules, and post-booking follow-ups, cutting response delays by 70%.
- Created modular automation templates for scalable reuse across campaigns, reducing setup time by 50% and improving operational consistency.
- Monitored workflow performance with custom logging and error handling, ensuring high reliability and measurable ROI.
- Engineered logic-based branching and conditional triggers to personalize user journeys, maximizing booking success and client satisfaction.

Mobile Developer for BillSense Application
(January 2025 – December 2025)

App using Android Studio and Java, leveraging Convolutional Neural Networks (CNN) to accurately distinguish between genuine and counterfeit bills, ensuring enhanced security and fraud prevention.

Trained a CNN model for image-based currency authentication, improving detection accuracy. Implemented real-time verification with native Java, optimizing fraud detection speed and user experience. Designed an intuitive UI/UX for seamless navigation, enhancing accessibility and usability. Developed automated data processing pipelines for efficient counterfeit analysis. Integrated AI-powered workflow enhancements, improving detection reliability. Ongoing development with continued model refinement and feature expansion.
